

Using a Bulk Tape Eraser to Clear Crystals

Metal and stones store information similar to tapes and magnetic stripes.

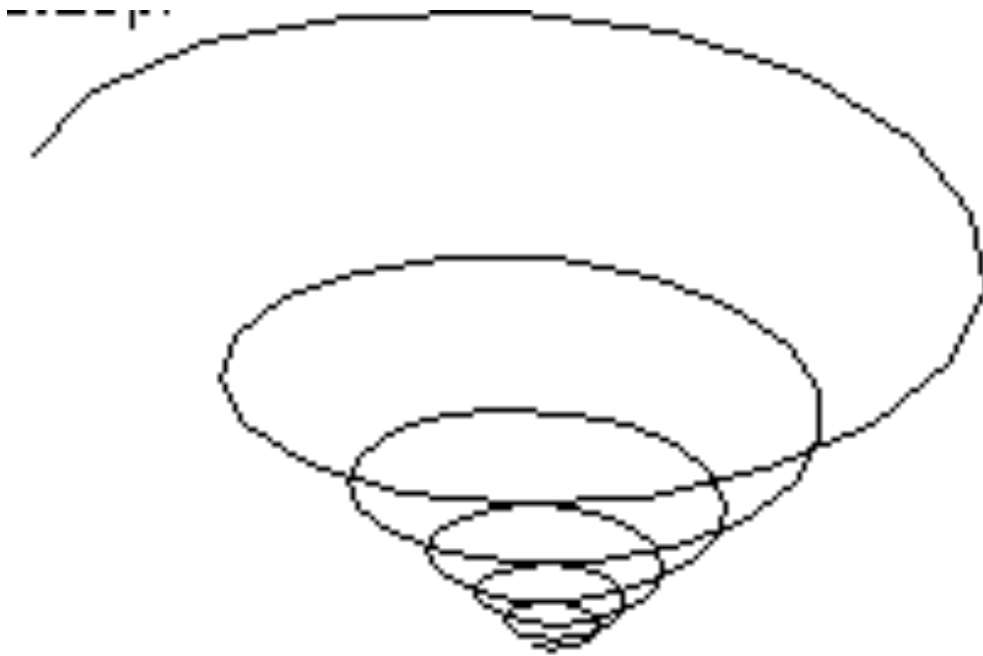

Deleting that information allows for new information to be recorded. It also eliminates old programs which may or may not have been intentionally recorded.

People often remark, "Wow! It's like you polished my jewelry!"

Plug in the device and hold it over the object you wish to erase information from.

The device should be as close as possible to the object and it's ok if it touches. Activate the device and move it in random motions over the item for 5-10 seconds.

Gradually move the device away from the object in an ever expanding counter clockwise spiral.

The field needs to be continuous during the entire process. Keep your finger on the button so the device remains activated the whole time, until you've completed the spiral.
